Stateless Search Analysis

To Be Done

- Token Validation
  - Implement middleware for validating token authenticity and expiry at each API Call
  - Return standardized error codes for expired/invalid tokens
- Token Lifecycle

Acceptance Criteria

- Generic Token Validation Layer
- Caching Service
- Booking flow must work without the server side session storage

JSON Web Token (JWT)

- Token will be generated according to the FlightOption
- No need to hash the flightOption as the generated token will contain this object
- Claims will be:
  - iss (issuer) → "book-now", "fare-confirm", "apply-fare-rule"
  - exp (expiration) → Defines when the token expires
  - iat (Issued At) → when the token was created
- Secret Key will be set from DevOps
- Expiration will be also set from DevOps
